## Consider The Time Value of Money

### It's Never Too Early To Start Saving For Retirement... In Fact, It's Better To Start Early!

The power of compounding interest can have an astounding effect on saving for retirement. Below is an example of two people, Chad and Chris. Both saved \$4,000 per year for twenty years. Chad started his family at a young age and also began saving when he was just 20 years old and continued saving until he was age 41. He counted on the power of compounding interest to help him secure his retirement. Chris, on the other hand, started saving at age 40 continuing to save until she was age 61. Let's see the significant effect that the time value of money had on the twenty years of retirement saving done by both Chad and Chris.

**By age 65 here's what they have accumulated @ 4.0%**

**\$330,235** Chad's Savings at Age 65

**- 150,715** Chris' Savings at Age 65

**\$179,520** The Time Value  
of Money Difference
